EMPLOYEE PAYROLL PROCESSOR

By Stduent Ashutosh MISHRA , SUBJECT : HTML,CSS ,JAVASCRIPT , (SEMESTER 2)

Index

Slide 1 — Problem Statement

Payroll management in organizations often requires calculating employee salaries, tax deductions, and maintaining payroll records. When done manually, payroll processing can be time-consuming and prone to calculation errors.

The challenge is to develop a **web-based payroll system** that can automatically calculate employee salaries, manage payroll records, and store payroll data efficiently.

The system should support different employee types and allow exporting payroll data into spreadsheet format.

Slide 2 — Solution

To solve this problem, the **Employee Payroll Processor (PayrollPro)** was developed using **HTML, CSS, and JavaScript**.

The system provides a dashboard where users can:

• Add employee details

• Select employee type

• Automatically calculate salary and tax deductions

• Store payroll records using browser local storage

• Export payroll records into CSV spreadsheet format

This solution automates payroll calculations and improves record management.

Slide 3 — Working (Method)

The system works through the following steps:

1. User enters employee details using **HTML forms**
2. Employee type is selected (Full-Time, Contract, Hourly)
3. **JavaScript** creates an employee object based on type
4. Salary and tax are calculated automatically
5. Payroll results are displayed on the dashboard
6. Payroll records are saved using browser **localStorage**
7. Users can export payroll records into a spreadsheet (CSV file)

Slide 4 — Conclusion

The **Employee Payroll Processor** successfully demonstrates how **HTML**, **CSS**, and **JavaScript** can be used to build a payroll management system.

The system automates salary calculations, stores payroll records permanently, and provides spreadsheet export functionality.

This project improves payroll efficiency and reduces manual calculation errors while demonstrating practical web development concepts.
